B The invention provides eleven human proteins, which are believed to be chaperone proteins (HCPN) based on sequence homol. to known heat-shock, chaperone and DnaJ proteins. The invention also provides cDNA mols. encoding the HCPN sequence homologs. The invention further provides a DNA construct contg. a promoter linked to said HCPN cDNA mols., and a cell and/or organism transformed for with said DNA construct, which are used for recombinant prodn. of HCPN. Still further the invention provides: (1) a pharmaceutical compn. contg. said HCPN; (2) antibodies specific for

HCPN; (3) primers and/or probes specific for polynucleotides encoding HCPN; (4) RNA equiv. of HCPN cDNA mols.; and (5) mol. genetic techniques, such as polymerase chain reaction (PCR) and/or nucleic acid hybridization for detecting polynucleotides encoding HCPN using said primers and probes. Finally the invention provides: (1) screening methods for agonists and/or antagonists of HCPN, and (2) use of identified agonists and/or antagonists in treating a disease or disorder assocd. with an imbalance of functional HCPN. The cDNA sequences as well as the corresponding amino acid sequences of the HCPN sequence homologs are provided. The invention presented information on the cloning of each cDNA mol., including what tissues were utilized in constructing the cDNA libraries. In addn., the invention presented information on the structure and potential function of the HCPN including: (1) potential phosphorylation and glycosylation sites; (2) signature sequences and protein motifs; and (3) proteins from other organisms that show homol. Finally, the invention presented information on the tissue expression of the cDNA clones as detd. by Northern blot, and diseases and/or disorders assocd. with these tissues.

Human papillomavirus replication initiator, the E1 helicase, binds weakly to the origin of DNA replication. Purified ***human***
chaperone ***proteins*** Hsp70 and Hsp40 (HDJ-1 and HDJ-2) independently and additively enhanced E1 binding to the origin. The interaction between E1 and Hsp70 was transient and required ATP hydrolysis, whereas Hsp40 bound to E1 directly and remained in the complex. A peptide of 20 residues spanning the HPD loop and helix II of the J domain of YD3-1 also stimulated E1 binding to the origin, alone or in combination with Hsp70 or Hsp40. A mutated peptide (H34Q) had a reduced activity, while an adjacent or an overlapping peptide had no effect. Neither Hsp70 nor the J peptide altered the E1/DNA ratio in the complex. Electron microscopy showed that E1 mainly bound to DNA as a hexamer. In the presence of Hsp40, E1 primarily bound to DNA as a dihexamer. Preincubation of chaperones with viral E1 and template shortened the lag time and increased replication in a cell-free system. Since two helicases are essential for bidirectional replication of human papillomavirus DNA, these results demonstrate that, as in prokaryotes, chaperones play an important role in the assembly of preinitiation complexes on the origin.
